

NYC Short-Term Rental Market Teardown

A Data-Driven Analysis of Pricing, Inventory, and Operational Mechanics

Extracted from the Real Estate Intelligence Dashboard.

Yield Baseline

\$623.79

Average Daily Rate (ADR)

Establishes the high-value nature of the market, requiring premium operational standards to justify the baseline price point.

Utilization Baseline

129.78 Days

Average Annual Availability

Indicates tight inventory control and seasonal blocking, showing that the average listing is not available year-round.

The Revenue-Fee Correlation Curve

Margin Implications

As the Average Daily Rate pushes past the \$620 baseline, platform service fees scale proportionally.

Operators must carefully model net margins rather than optimizing solely for top-line revenue.

Market Dominance Matrix

The NYC short-term rental market is highly concentrated. Investment and operational strategies must be calibrated for the Manhattan/Brooklyn duopoly (85% combined share), which dictates the \$623 ADR benchmark.

The Borough Diagnostic Table

Manhattan
42%

Typology: High-Density Vertical

Combined, these boroughs represent 85% of all active listing intelligence.

Brooklyn
43%

Typology: Mid-Density Walk-up

Market parity: Despite differing physical landscapes, total listing volume is nearly identical, proving robust demand across both geographic typologies.

Listing Configuration Framework

Operators must align their real estate acquisition strategy directly with these four recognized platform configurations to ensure visibility in search filtering.

Construction Age Timeline

Insight

The bulk of active STR inventory relies on mid-2010s construction. Operators bringing 2021+ newer builds to market possess a distinct structural advantage against an aging primary supply.

The Trust Equation

Verification is not just a security feature; it is an algorithmic necessity. Verified hosts capture significantly higher review velocity, driving listing visibility and sustained bookings.

Booking Policy Matrix

		X-Axis	
		Conversion Lever: Instant Bookable	
		TRUE	FALSE
Y-Axis Risk Lever: Cancellation Policy	Flexible	High Conversion / High Risk	
	Moderate		
	Strict		Low Conversion / Low Risk

The most sophisticated operators do not set policies by default; they toggle these levers based on seasonal demand, utilizing strict policies during peak periods and flexible/instant terms to fill the 129-day annual availability gaps.

The NYC Airbnb Optimization Triangle
